

# Project 1s and 2s

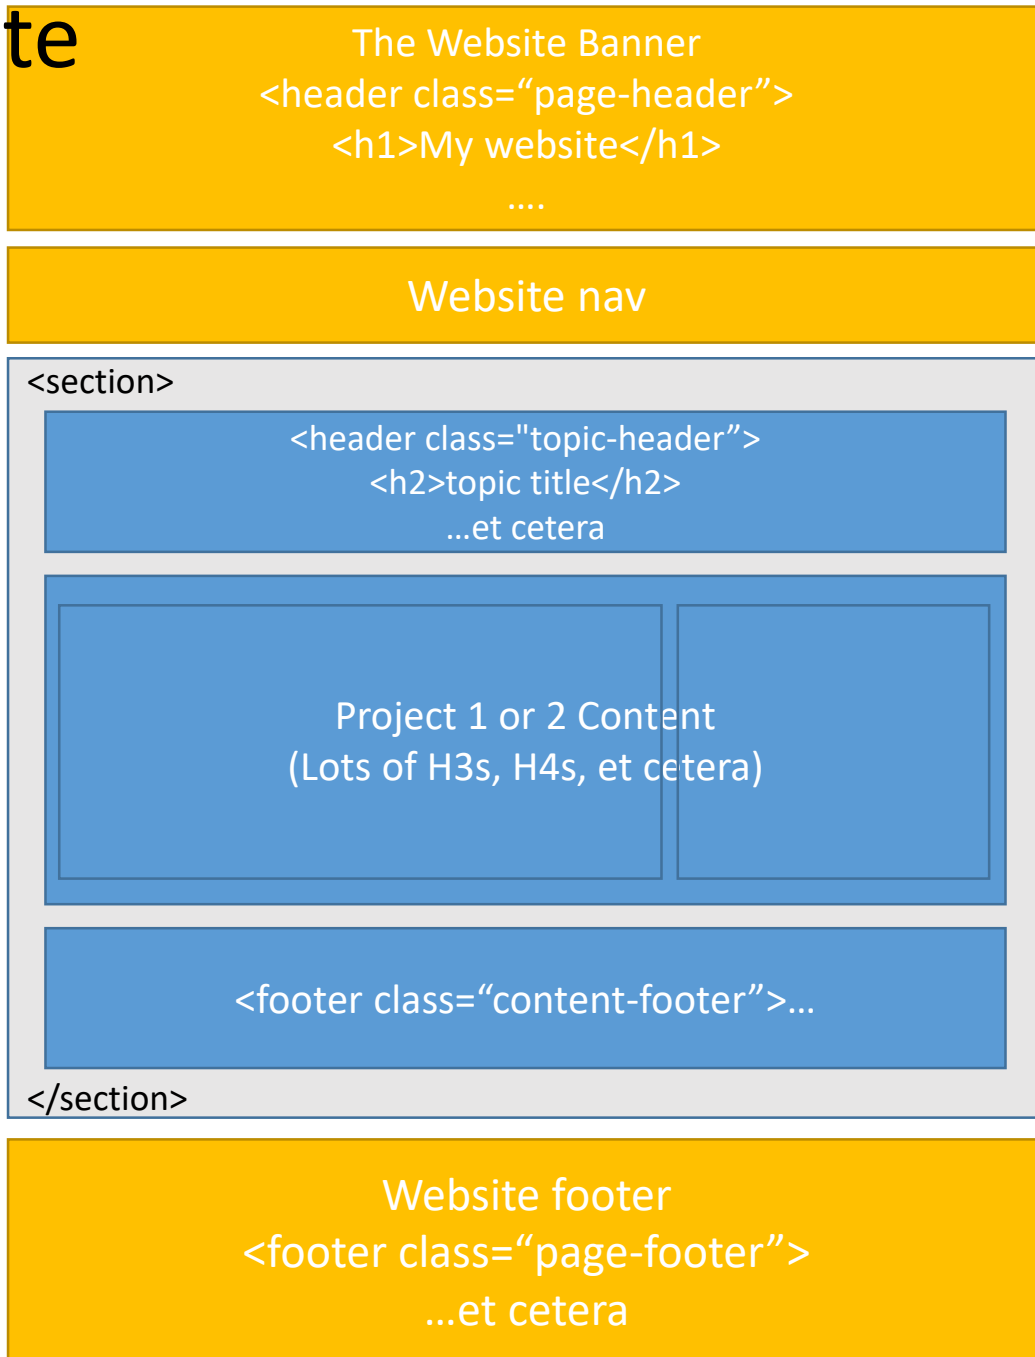

# Project 3 HTML Template

Part of the suggested workflow for creating your Project 3 website includes: creating an HTML template

The following steps deal with HTML only. After you complete these steps *then* start wrestling with your CSS

1. In a new HTML file create a new HEADER, NAV, and FOOTER element
2. Add classes to the new HEADER and new FOOTER, e.g. class="page-header" and class="page-footer"
3. Create a new SECTION element between the NAV and page-footer
4. In the SECTION element, insert your content from your Project 2
5. Within the section “demote” the headings: h1 becomes h2; h2s become h3; et cetera
6. Add new content to the new page-header, nav and page-footer
7. Copy this file x4 and replace the content in the SECTION with content from the three other students’ project 1s, and use the forth copy for your new index (home) page

■ = the new “superstructure” you build around each webpage in your website

“Demote” the headings in the outline; H1s become H2s; H2s become H3s; et cetera

■ = the content from your Project 2 and other students’ Project 1s
